TITLE : REFLECTION TYPE LIQUID CRYSTAL
PANEL

ABSTRACT : PROBLEM TO BE SOLVED: To embody the reduction in the thickness of a reflection type liquid crystal panel by incorporating light storable phosphors into protective films themselves holding polarizing films of a reflection type liquid crystal panel.

SOLUTION: This liquid crystal panel comprises liquid crystal substrates A, a pair of upper and lower polarizing plates B, C which hold the liquid crystal substrates A from both sides and a reflection plate D which is disposed on the rear surface of the lower polarizing plate C. In addition, the lower polarizing plate C is so constituted as to consist of a three-layered structure composed of the polarizing film 16 and the protective films 17a, 17b arranged on both sides thereof. In such a case, the light storable phosphors are incorporated into at least the protective film of one side of the protective films 17a, 17b constituting the lower polarizing plate C.
